### Commitment

It allows one to commit to a chosen value while keeping it hidden to others.

However, it can be revealed at a later time when the one opens necessary parameter.

- Hiding; a given *x* and its commitment should be unrelatable.
  - $\Rightarrow$  should reveal no information about x
- Binding; there is no way that different values can result in the same commitment.
  - ⇒ cannot change the value after committing

#### cf.

- Encryption
- Hash function

## **Pedersen Commitment [Ped92]**

- Setup $(1^{\lambda})$ ;
  - $\circ$  Choose a large prime q and p such that p=2q+1
  - $\circ$  Choose  $g \leftarrow \mathbb{Z}_q^*$
  - $\circ \;\;$  Choose  $s \leftarrow \mathbb{Z}_q^*$  aand compute  $h := g^s$
  - $\circ$  Output (p, q, g, h)
- Com(x);
  - $\circ$  Choose  $\gamma \leftarrow \mathbb{Z}_q^*$
  - $\circ$  Output  $q^x h^{\gamma}$
- Open(Com $(x), x, \gamma$ );
  - Check whether c is equal to  $g^x h^r$  or not

#### **Note**

- ullet  $\Sigma$ -Protocols: to prove knowledge of a committed value, equality of two committed values and so on.
- ullet Since  $g^{x_1}h^{\gamma_1}\cdot g^{x_2}h^{\gamma_2}=g^{x_1+x_2}h^{\gamma_1+\gamma_2}$  ,

$$\mathsf{Com}(x_1,\gamma_1)\cdot\mathsf{Com}(x_2,\gamma_2)=\mathsf{Com}(x_1+x_2,\gamma_1+\gamma_2)$$

- **Linear relatioships** among committed values can be shown through Pedersen commitments.
  - One could show that y = ax + b for some public values a and b, given Com(x) and Com(y).

### **Example 1.** ( $\Sigma$ -protocol for Pedersen Commitment)

Let p be a DL-secure prime and  $g, h \leftarrow \mathbb{Z}_n^*$ .

Prover and Verifier knows g, h and  $y = g^x h^{\gamma}$ .  $(y = \mathsf{Com}(x))$ 

Prover claims <u>to know a committed value x and  $\gamma$ .</u>

- 1. [Announcement]
  - $\circ \ \ \mathsf{Choose} \ s,t \leftarrow \mathbb{Z}_q^*$
  - $\circ$  Compute  $a = g^s h^t$
  - Send a to Verifier
- 2. [Challenge]
  - $\circ$  Choose  $c \leftarrow \mathbb{Z}_q^*$
  - $\circ$  Send c to Prover
- 3. [Response]
  - Compute  $r_1 = cx + s$  and  $r_2 = c\gamma + t$
  - $\circ$  Send  $r_1$  and  $r_2$  to Verifier
- 4. [Verification]
  - $\circ \;\;$  If  $y^c \cdot a = g^{r_1} h^{r_2}$  , then Verifier accepts
  - o Otherwise, Verifier rejects

## Example 2.

Let p be a DL-secure prime and  $g, h \leftarrow \mathbb{Z}_p^*$ .

Prover and Verifier knows g,h and  $y_1=g^{x_1}h^{\gamma_1}$  and  $y_2=g^{x_2}h^{\gamma_2}$  .

Prover proves knowledge of  $x_1$  and  $x_2$  such that  $x_2=\alpha x_1+\beta$ , that is, proving knowledge of x such that

$$\{y_1=\mathsf{Com}(x_1)\wedge y_2=y_1^lpha g^eta\}$$

- 1. [Announcement]
  - $\circ$  Choose  $s_1, s_2, t_1, t_2 \leftarrow \mathbb{Z}_q^*$
  - $\circ \;\;$  Compute  $a_1=g^{s_1}h^{t_1}$  and  $a_2=g^{s_2}h^{t_2}$
  - Send  $a_1$  and  $a_2$  to Verifier
- 2. [Challenge]
  - $\circ$  Choose  $c_1, c_2 \leftarrow \mathbb{Z}_q^*$
  - $\circ$  Send  $c_1$  and  $c_2$  to Prover
- 3. [Response]
  - $\circ$  Compute  $r_1=c_1x+s_1, r_2=c_1\gamma+t_1, r_3=c_2y+s_2$  and  $r_4=\alpha c_2\gamma_1+t_2$
  - $\circ$  Send  $r_1, r_2, r_3$  and  $r_4$  to Verifier
- 4. [Verification]
  - $\circ$  If  $y_1^{c_1}\cdot a_1=g^{r_1}h^{r_2}$  and  $y_1^{c_2lpha}\cdot a_2\cdot g^{c_2eta}=g^{r_3}h^{r_4}$ , then Verifier accepts
  - o Otherwise, Verifier rejects

### zkSNARKs

zero-knowledge of Succinct Non-interactive ARguments of Knowledgs

	$\Sigma$ -Protocol	zkSNARKs
Algebraic Statement	no trusted setup	
	short proof size	
Non-Algebraic Statement	large proof size	succinct proof size
		verifiable computation

# **Privacy Problem in BTC**

- Anonymity: hiding identities of sender and receiver
  - Monero uses a ring signature and a stealth address
  - ZCash uses a zero-knowledge proof
- Confidentially: hiding the amount transferred
  - Monero uses a confidential transaction (CT)
    - every transaction amount is hidden using a commitment to the amount
  - ZCash uses a commitment and a public key encryption

In CT, a zero-knowledge for range proof is used.

- 1.  $\sum input \ge \sum output$
- 2. all transferred value  $\geq 0$

### **Current Proposals for CT-ZKP**

- [PBF+]: large proof size or required a trusted setup
- SNARKs: required a trusted setup
- STARKs: large range proof

 $\Rightarrow$  Bulletproof: [BBB+18] @ S&P'18
